

READY-HEAT INFANT-WARMING COCOON FROM TECHTRADE, LLC

Without question, two of the greatest feelings in EMS are running a near-flawless resuscitation and delivering a baby. Actually saving a life and bringing a new life into the world are EMS moments that still take my breath away.

On the topic of taking care of those new lives, let's look at the Ready-Heat Infant-Warming Cocoon from TechTrade, LLC, who've brought to market the first totally portable, heated, disposable blanket designed for critical-care infant transport. Given the minimal physiologic capabilities of a newborn, and even more so when you consider preemies, excessive heat loss after delivery can quickly result in potentially catastrophic results. Having a Ready-Heat Infant-Warming Cocoon at your disposal solves that problem before it becomes a problem.

The blanket has a synthetic outer material with a water-resistant finish over a foam core and six customized heating panels, which are secured in separate sealed pockets. Once they're activated, you can feel the temperature start to quickly rise and the placement of the heat panels provides circumferential warming for hypothermia prevention and temperature management. The cocoon-like design provides optimal use of the heat being generated and limits heat loss to a minimum.

The Ready-Heat Infant-Warming Cocoon is a real no-brainer to use, which is a great quality, given the chaos that often surrounds many field deliveries. Simply tear open the protective outer package, expose the Cocoon to air, and it will begin to heat up immediately, reaching full temperature in about 15 minutes. Get the baby wrapped up and mom squared away, and let Junior have a nice warm ride to the hospital with nary a worry about hypothermia.
